A responsive dashboard adapts to different screen sizes—desktop, tablet, or phone—so it looks good and is easy to use everywhere. Use flexible layouts, simplify visuals for small screens, keep fonts and colors clear, and test on multiple devices. This ensures everyone can view and interact with your data smoothly.

SOLUTION--This project presents a responsive Tableau dashboard for analyzing heart disease data. The dashboard includes multiple visualizations such as gender-based comparison, race distribution, and the impact of smoking on heart disease. The layout adapts to different screen sizes to ensure better usability and data interpretation.

1. Open Tableau Public and connect the dataset by selecting **Text File** and loading the Heart_Cleaned.csv dataset.
2. After loading the data, open **Sheet 1** to begin creating visualizations.

3. Create a **Bar Chart** for Gender vs Heart Disease by dragging *Sex* to Columns, *Count of Records* to Rows, and *Heart Disease* to Color.
4. Create a new worksheet and build a **Pie Chart** for Race distribution by dragging *Race* to Color and *Count of Records* to Angle and Label.
5. Create another worksheet to analyze the **impact of smoking** by dragging *Smoking* to Rows, *Count of Records* to Columns, and *Heart Disease* to Color.
6. Create another worksheet to analyze **Diabetic vs Stroke** by placing *Diabetic* in Columns and *Stroke* in Rows and using circle marks.
7. Click on **New Dashboard** to combine all created worksheets into a single dashboard view.
8. Drag all the sheets into the dashboard and arrange them in a **2×2 grid layout** for better visualization.
9. Add a **dashboard title** such as "Heart Disease Analysis Dashboard" to clearly describe the dashboard purpose.
10. Use **Device Preview** to ensure the dashboard is responsive for desktop, tablet, and phone screens.
